

Amazon Sales Analysis Using Python and Exploratory Data Analysis

Project Overview

In this project, I analyzed Amazon sales data using Python and Exploratory Data Analysis (EDA). The main purpose was to understand sales performance, identify top-performing categories, analyze customer locations, and generate business insights.

Business Objective

Understand sales performance, identify high-revenue categories, analyze state-wise sales, study fulfillment methods, investigate cancellations, and generate recommendations.

Dataset Information

Total Records: 128,975

Total Columns: 24

Data Cleaning and Preparation

Removed the 'Unnamed: 22' column, converted Date to datetime, checked missing values and duplicates, and created Month, Year, and Day columns.

Revenue Analysis

Total Revenue: ₹7.86 Crore. The Set category generated the highest revenue, followed by Kurta and Western Dress.

State-wise Revenue Analysis

Top states by revenue were Maharashtra, Karnataka, and Telangana.

Order Status Analysis

Approximately 14% of orders were cancelled. Most orders were successfully shipped or delivered.

Fulfillment Analysis

Around 70% of orders were fulfilled by Amazon and 30% by merchants.

Key Findings

- Total revenue was approximately ₹7.86 Crore.
- Set was the highest revenue-generating category.
- Maharashtra generated the highest revenue.
- Amazon fulfilled around 70% of orders.
- Cancellation rate was approximately 14%.

Conclusion

The analysis identified major revenue drivers, geographic sales patterns, and fulfillment trends that can support better business decisions.
